Math 270 Basic Discrete Math Practice Test 3

Sections 5.1, 5.2, 5.3, 5.4, 5.6, 5.7

Directions: Answer the problems below. You may use scientific (non-graphing) calculators, but no other electronic devices. Show all work.

1. Prove, using mathematical induction, that for all integers $n \geq 1$,

$$3 + 7 + 11 + \dots + (4n - 1) = 2n(n + 1) - n.$$

Proof: let P(n) = "3+7+11+ ...+ (4n-1) = 2n(n+1)-n".

We prove P(n) holds for all n > 1 by induction.

Base are (n=1): We show P(1) holds: the LHS of P(1) is 3, whereas the RHS of P(1) is $2 \cdot 1(1+1) - 1 = 4 - 1 = 3$, so LHS = RHS and P(1) holds.

Industrice Step: Let k=1 be arbitrary and square P(k) holds, so $3+7+11+\cdots+(4k-1)=2k(k+1)-k$.

We must show P(K+1) helds, i.e. that

Starting with the LHS,

$$3+7+11+\cdots+(4k-1)+(4(k+1)-1)=(3+7+\cdots+(4k-1))+(4(k+1)-1)$$

$$=(2k(k+1)-k)+(4(k+1)-1)$$

$$=2k(k+1)-k+2\cdot 2(k+1)-1$$

$$=2(k+2)(k+1)-(k+1)$$

$$=2(k+1)(k+2)-(k+1).$$

So P(K+1) holds, proving the inductive styp.

Since the inductive styp and base case hold, P(n) is true to all integes n=1 >>>

2. Let a_1, a_2, a_3, \ldots be the sequence defined recursively as follows:

$$a_1 = 1$$
, $a_2 = 20$, and for all $k \ge 3$, $a_k = 5a_{k-1} + 6a_{k-2}$.

Use strong induction to prove that for all integers $n \ge 1$, $a_n \le 6^n$.

Proof: let P(n) = "an = 6"". We show P(n) holds to all no 1 by strong induction.

Bax Caxs (n=1,2): Since a = 1 € 6 = 6' and az= 20 € 36 = 62, both P(1) and P(2) hold.

Inductive Step: let k=2 be arbitry and square P(1), P(2), ..., P(k) all hold. We want to show that P(k+1) holds, i.e., that are < 6k+1.

Since k=2, K+1=3, so

$$a_{k+1} = 5a_k + 6a_{k-1}$$
 (By dediction of gian as $k+1 \ge 5$)
$$= 5 \cdot 6^k + 6 \cdot 6^{k-1}$$
 (J.H.: $P(k-1)$ AND $P(k-2)$ hold)
$$= 5 \cdot 6^k + 6^k$$

$$= 6 \cdot 6^k$$

$$= 6 \cdot 6^k$$

$$= 6^{k+1}$$

hold, P(n) is true for all n=1 by strong induction.

- **3.** Provide short responses for parts a.-d. below.
- a. Calculate each of the following:

i.
$$\prod_{i=1}^{4} (2i) = 2 \cdot 4 \cdot 6 \cdot 8 = 384$$

ii.
$$\sum_{i=1}^{4} (2i-1) = 1 + 3 + 5 + 7 + 16$$

iii.
$$\frac{4!}{2!} = \frac{4! \cdot 3 \cdot 2 \cdot 1}{2 \cdot 1} = 4 \cdot 3 = 12$$

iv.
$$\binom{6}{2} = \frac{6!}{2! \cdot 4!} = \frac{6:5}{2:1} = 15$$

$$\mathbf{v.} \begin{pmatrix} 6 \\ 4 \end{pmatrix} = \frac{\mathbf{c'}}{\mathbf{q'} \mathbf{z'}} = \boxed{\mathbf{5}}$$

vi.
$$\binom{6}{0} = \frac{6!}{6!} = \frac{1}{0!} = 1$$

b. Suppose the sequence a_1, a_2, a_3, \ldots begins with the terms $8, -27, 64, -125, 216, \ldots$ Find an explicit formula for a_n .

$$a_n = (-1)^{n+1} (n+1)^3$$

c. Write the product $(1-t)(1-2t^2)(1-3t^3)(1-4t^4)$ using product notation.

$$= \frac{4}{1-i+i} \left(1-i+i\right)$$

d. Transform the sum $\sum_{j=3}^{n+1} \frac{j^2-1}{n-j+2}$ by making the change of variable i=j-2.

$$\hat{i} = \vec{3} - \vec{2} : \vec{j} = \vec{3} \Rightarrow \vec{i} = 1$$

$$\vec{j} = n+1 \Rightarrow \vec{i} = n-1$$

$$\vec{j} = \vec{i} + \vec{2}$$

- 4. Find explicit formulas for the following recurrence relations. (You do not need to prove your answers are correct.) Simplify your answers as much as possible: for full credit your answers should include no summation or product notation.
- **a.** $a_1 = 1$, $a_k = a_{k-1} + 2$ for all $k \ge 2$.

$$6i = 6. + 2 = 1 + 2$$

 $6s = 6i + 2 = (1+2) + 2$
 $6s = 6i + 2 = (1+2) + 2$
 $6s = 6i + 2 = (1+2) + 2$
 $6s = 6i + 2 = (1+2) + 2$
 $6s = 6i + 2 = (1+2) + 2$
 $6s = 6i + 2 = (1+2) + 2$
 $6s = 6i + 2 = (1+2) + 2$
 $6s = 6i + 2 = (1+2) + 2$
